

Programming in C++

<https://fan1x.github.io/cpp21.html>
tomas.faltin@matfyz.cuni.cz

Basic information

- Email: tomas.faltin@matfyz.cuni.cz
- Labs web: <https://fan1x.github.io/cpp22.html>
- Lecture web: <https://www.ksi.mff.cuni.cz/teaching/nprgo41-web/>
- Mattermost
 - Invite link in [SIS/Notice-board](#)
 - Channel: `nprgo41-cpp-faltin`
- Gitlab
 - <https://gitlab.mff.cuni.cz/>
 - <https://gitlab.mff.cuni.cz/teaching/nprgo41/2022-23/faltin>

Communication is the key

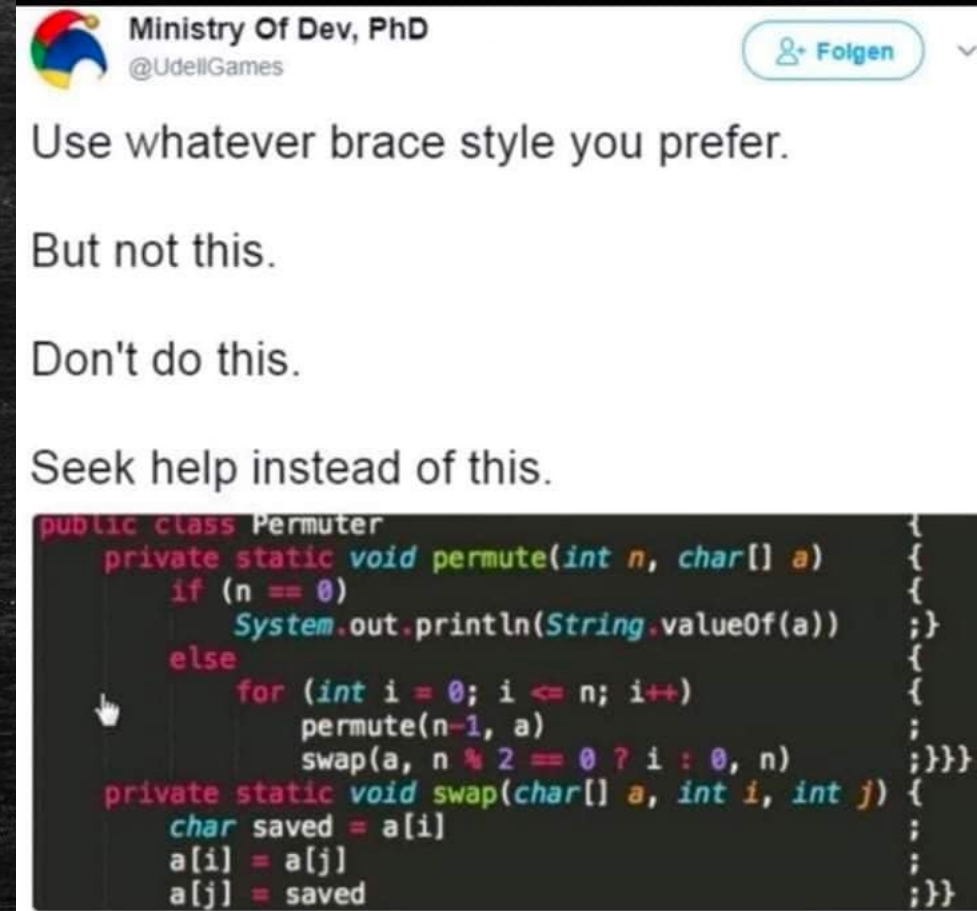

- Don't be afraid to ask
- Be proactive
 - via email
 - on Mattermost (instant)
 - DM if related to you only
 - Into a channel if others can benefit from it
- If you struggle with something
- If you feel like you might miss a deadline

Labs credit

- Submitted homeworks before Sunday midnight (Sunday 23:59)
 - to Gitlab
 - Even if not attending!
 - Won't be graded, for feedback only
- Two large homeworks in ReCodex (total 40 points)
 - Points are included in the final score from the course
 - Smaller HW – 15 points, ~November
 - Larger HW – 25 points, ~December
- Software project
 - Topic must be approved by 27/11/2022
 - POC: 18/12/2022
 - First submission: 02/04/2023
 - Final submission: 28/05/2023
 - **All the steps typically mean multiple iterations within multiple days. If you wait for the last minute, there is a chance you won't make it**

Code Requirements - Consistency

- Consistency
 - Be consistent within the code
 - keep a single code style

The image is a screenshot of a tweet from a user named "Ministry Of Dev, PhD" with the handle "@UdellGames". The tweet text reads: "Use whatever brace style you prefer. But not this. Don't do this. Seek help instead of this." Below the text is a code snippet in Java. The code is for a class named "Permuter" and contains two methods: "permute" and "swap". The "permute" method has a nested "if-else" structure. The "if" branch contains a "System.out.println" statement. The "else" branch contains a "for" loop that calls "permute" recursively and then calls "swap". The "swap" method is a private static method that swaps two elements in an array. The code is formatted with a mix of spaces and tabs, and the indentation is inconsistent, which is the point of the tweet.

```
public class Permuter
{
    private static void permute(int n, char[] a)
    {
        if (n == 0)
        {
            System.out.println(String.valueOf(a));
        }
        else
        {
            for (int i = 0; i <= n; i++)
            {
                permute(n-1, a);
                swap(a, n % 2 == 0 ? i : 0, n);
            }
        }
    }
    private static void swap(char[] a, int i, int j)
    {
        char saved = a[i];
        a[i] = a[j];
        a[j] = saved;
    }
}
```

Code Requirements – Readability

- Code doesn't contain commented/dead parts
- Code should be readable on its own
- Comment complicated code

Code Requirements – Safe, Modern

- Prefer using modern constructs
- Additional safety
- Maybe performance
- E.g., prefer `std::vector<int>` to `new int[]`

Me when I realized that I can't pass 2D arrays to functions in C/C++ as `int a[]`:

"Pointers are a nuisance"

Code Requirements – Working

- OFC, if the code is not working, all the above points are not that important
- they will help you with debugging at least 😊

Why C++

"C makes it easy to shoot yourself in the foot. C++ makes it harder, but when you do, it blows away your whole leg."

-- Bjarne Stroustrup

"It was only supposed to be a joke, I never thought people would take the book seriously. Anyone with half a brain can see that object-oriented programming is counter-intuitive, illogical and inefficient."

-- Stroustrup C++ 'interview' (<https://www-users.cs.york.ac.uk/susan/joke/cpp.htm>)

Working Environment

- Use anything you like 😊
- IDEs
 - Visual Studio
 - License for students at <https://portal.azure.com/...>
 - VS Code
 - Clion
 - Code::Blocks
 - Eclipse
 - ...
- Compilers
 - MSVC, GCC, Clang+LLVM, ICC, ...

C++ (interesting) links

Learning C++

- C++ in 100 seconds: <https://youtu.be/MNeX4EGtR5Y>
- C++ in 31h: https://youtu.be/8jLOx1hD3_o

Hello World

```
#include <iostream>
#include <string>

int main() {
    std::string name;
    std::cin >> name;
    std::cout << "Greetings from " << name << std::endl;
    return 0;
}
```

Hello World

```
#include <iostream>
#include <string>
```

```
int main() {
    std::string name;
    std::cin >> name;
    std::cout << "Greetings from " << name << std::endl;
    return 0;
}
```

Include the libraries
which implements the
used STL constructs
(string, cin, cout)

The main entry
point/function for all
programs. The
execution starts here

Declare a variable
of type string

All the STL
constructs live
inside 'std'
namespace

Write to
standard output
(screen)

Read from
standard input
(keyboard)

Compilation

- `c++ --version`
 - `c++` is a compiler, here GCC
- `c++ hello_world.cpp -o hello_world`
 - Compile program into ``hello_world`` executable (using default settings)
- `c++ -Wall -Wextra -Werror -O3 -std=c++2b hello_world.cpp -o hello_world`
 - `Wall`: Show all warnings
 - `Wextra`: Show additional extra warnings
 - `Werror`: Thread all warnings as errors
 - `O3`: level of optimizations
 - `std=c++2b`: Used C++ standard
- Or use IDE 😊

More Complex Program

```
#include <iostream>
#include <string>
#include <vector>

using namespace std;

void pretty_print(const vector<string>& args) {
    // ... args[i]
}

int main(int argc, char** argv) {
    vector<string> args(argv, argv+argc);
    pretty_print(args);
    return 0;
}
```

More Complex Program

```
#include <iostream>
#include <string>
#include <vector>
```

Include the whole
std namespace

```
using namespace std;
```

Passing the
argument by
(const) reference

```
void pretty_print(const vector<string>& args) {
    // ... args[i]
}
```

Number of
arguments

Arguments of the
program on the
command line

```
int main(int argc, char** argv) {
    vector<string> args(argv, argv+argc); // Wrap arguments
    pretty_print(args);
    return 0;
}
```

Transform
"magically" the
arguments into C++
array of strings

Functions And Parameters

```
int get_max(int v1, int v2) {  
    return v1 > v2 ? v1 : v2;  
}
```

```
int get_max1(const vector<int> &ints) {  
    int max = std::numeric_limits<int>::min();  
    for (int x : ints) {  
        max = get_max(x, max);  
    }  
    return max;  
}
```

```
bool get_max2(const vector<int> &ints, int &max) {  
    max = std::numeric_limits<int>::min();  
    for (int x : ints) {  
        max = get_max(x, max);  
    }  
    return !ints.empty();  
}
```

```
std::tuple<bool, int> get_max3(const vector<int> &ints) {  
    int max = std::numeric_limits<int>::min();  
    for (int x : ints) {  
        max = get_max(x, max);  
    }  
    return { !ints.empty(), max };  
}
```

Functions And Parameters

- read-only input parameter
 - Most of the types (string, vector, ...) → use const-reference - **const &**
 - `int get_max(const vector<int> &ints)`
 - For small numeric types (int, float, double, ...) → use **direct parameter**
 - `int get_max(int v1, int v2)`
- output parameters
 - Single output parameter → use **return** value
 - `int get_max(const vector<int> &ints)`
 - Few output parameters → use **tuple/pair/structure**
 - `std::tuple<bool, int> get_max(const vector<int> &ints)`
 - Many output parameters → use reference - **&**
 - `bool get_max(const vector<int> &ints, int &max)`

Homeworks

1. Hello World
2. A greeting program (use names from arguments)
 - ``hello.exe Adam Eve`` → ``Hello to Adam and Eve``
 - What is inside `args[0]`?
3. Summation of numbers from arguments
 - ``sum.exe 1 2 3 4 5`` → ``15``
 - ``stoi(), stod(), stoX()``
 - Functions for transformation from string to <something>
4. A simple calculator (only for operations + -)
 - ``calc.exe 1+2+3-4`` → ``2``
 - to Gitlab
 - The previous programs are not needed, they should give you a lead
